

The Capstone Project I am peer reviewing did not have a title and went straight to the objective after the table of contents. I like the idea of the project because it is a growing technology that finds new adaptations everyday.

The main points are that NFC is a technology that allows very easy but very short distance communication between two objects embedded with the proper chip. All it requires is the two objects to be within close proximity of each other. Another point being made is how NFC can be useful for consumers and businesses. This is because consumers can make contactless payments without having to swipe their card. This will allegedly make it more secure for consumers as credit card information is less likely to be stolen. Another main point in the paper suggests that NFC is important in information sharing. NFC tags rely on radio frequency signals sent from a smart phone or other NFC compatible devices to operate instead of battery. This along with their small size let them go virtually anywhere.

The next main point is that it helps with people who use public transportation. It will help with overpayments on tickets as well as making it easier to find schedules for buses/trains. With the hectic lives people live today, this will undoubtedly be more convenient in today's age. The last point being made is that NFC is beneficial in social networking. The author states that with NFC tags, you can check-in to locations as well as exchange information just by bumping phones.

I think the main point about social networking could be better supported by more examples. It's also similar to the first main point in regards to bumping phones to exchange information. It is also similar to the main point about information sharing.

These main points highly revolve around sharing content with NFC. I'm sure there are much more benefits than sharing and networking. There is no main points that should be deleted but maybe merging them. There are no main points that are out of order and all requirements as far as topics for the capstone were met.

The writer used 10 resources and all of which were cited during the paper. All the correct formatting was used and in text-citations were done correctly. The only comment I have with the resources is that a lot of them are from the website. Nonetheless, there are at least 15 different resources.

There isn't much technical jargon the paper consists of. NFC is explained from the beginning. The only thing a reader who isn't tech savvy wouldn't understand is the one lone reference to RFID in the paper. The writer doesn't mention what RFID is exactly, but doesn't change the affect of the paper. Overall, I believe 98% of people who are not very techy-savvy would still understand this article. The paper however does not meet length requirements and is only 8 pages long. All sections and headings are labeled properly.

The thesis of this paper is that NFC technology has a numerous amount of benefits. The author believes the technology should be implicated in more things. The author supports his/her thesis with many examples as to how beneficial it is and why we should use it more. I don't believe there is any information missing from the paper, however I wish there were newer examples of NFC use as the ones listed have been out for sometime now. The single most important thing said in the paper was the authors hypothesis on NFC because it tells us what kind of stance they're taking.
