

This is peer review for the paper that I read for my fellow classmate. The author's project is on Internet Connectivity and comparing it within other countries versus America. The author has written a good introduction and has an interesting project, but I feel it is missing a necessary conclusion. When I read the paper I did not feel I understood what was the point of comparing the websites and internet speeds. I know the author has given examples about Facebook and Google but they are always doing something big. Google and Facebook or any other company such as Amazon are ten years ahead of the public. I believe that there should be other tactics or companies that the author should look into that are working privately to provide the internet. Such as in third world countries how the internet is being provided to them. However, the author does not have to necessarily take out the examples of Facebook and Google, but should look into NGO's and smaller companies that are working on providing internet.

Grammar – I did not see any grammar errors. Every sentence is written properly and correctly.

References – The author has ten references, and I was able to see some in his paper. I was able to reflect the author's point of view relating to the references and he has used the references perfectly.

Tables and figures – So far author has used one image showing web script for Marymount University website. However this project is still in process so I would assume the author would use more images.

Format – Yes the author has used format according to the guidelines provided by Dr.Narock. However, honor pledge is missing and the cover page is also not included.

Topic – Yes the topic could be completed in one semester. I do want to say that the author is working on the topic of the internet which is very well researched now a days especially, in US so the author should not have any trouble finding resources in his topic. Moreover the topic is kind of broad, as the author is working on how the internet is provided to other countries. The topic could more emphasize what are the steps that have been taken to provide the internet in poorer countries. It should also look into adding an action plan or “so what” section that looks at what we should do to help deliver the internet in poorer areas. Also it would be interesting to add perspectives from the other side that show maybe why the internet is not a good idea in poorer countries. The author has also mentioned about drone technology to provide the internet, but drone technology would be better suited in advanced countries. I am sure that drone technology would be affordable by third world countries.

Intellectual Content – After reading the author’s paper I think that author does have an understanding about the topic. The author is working on to have a research done about the Internet which is exciting to research on, since Internet is very complex in its own terms. I would be excited after the author finish his research and complete this project.
