This paper is well written. It flows logically and there are few grammatical errors.

The paper is also well researched showing a good understanding of SQL and relational databases. However, the paper jumps back and forth between topics making it difficult to follow. The author clearly describes a research project, which would seem to imply a detailed literature review and text to support a particular position. Yet, in the Project Plan there is discussion of installing an Oracle database and setting up a user interface. I find this makes the paper ambiguous. It is difficult to follow what is being built vs. what is being researched. What specifically will the author install and set up? Who will it be shown to? Most importantly, how does the installation and configuration of an actual database relate to the research study proposed?
